The user starts the program by opening a drawing, or creating a new one. Once the document is opened and the drawing is properly displayed, the user can begin working on the drawing by manipulating objects. This includes placing, selecting, or resizing these objects. The user can draw a number of different types of objects in a drawing: line, arc, circle, polyline, spline, and text. All the objects that can be placed, selected, and resized in the drawing have an associated command and a key combination associated with it. To select an object, the user has to press the corresponding key while pointing at the object or selecting the object with the mouse. To place an object, the user has to hold down the corresponding key while pressing the mouse button. Finally, to resize an object, the user has to hold down the corresponding key while moving the mouse. Pressing the Esc key cancels a command and returns the user to the command prompt. To view objects in a drawing, the user has to press the F5 key. To view the properties of the objects in the drawing, the user has to press F3. Unlike commercial CAD systems, AutoCAD is a complex piece of software. This is because AutoCAD is designed to work with very large technical drawings that are composed of many different elements. Before the development of AutoCAD, most CAD systems were tailored to a specific user's needs. They allowed a user to design parts of a product or a building with simple commands that did not have much in common with other parts of the design. On the contrary, AutoCAD was designed to be used by many people simultaneously. It was conceived so that it can be used to create technical drawings. Many other CAD programs have been developed over the years. This is because the design of AutoCAD was not the first time that CAD was implemented on a computer. The first CAD program that was developed was called Gerber, which was released in 1971 and was designed by the inventor of the integrated circuit, Douglas McConney. The first CAD program to be completely integrated on a computer was Design Engineering (Tektronix, 1968). A comparison of CAD systems Autodesk's AutoCAD is a complete CAD system that is designed to work with very large drawings that include a lot of different elements. That is why its total cost of ownership is much higher than other CAD programs. In order to

Wednesday, September 12, 2010 Advice to filmmakers looking to grab funding for their film ideas: Don't be a 'jerk' about money Filmmaking is a strange business, because as a whole, it is tough to make a decent profit. But, as much as it sucks to have a bad film that is totally wasted, you need to also appreciate how difficult it is to get a film made at all. But, even more difficult is to get one funded and distributed. That's why I wanted to share with you a few tips about how to be a smart, friendly, and professional filmmaker. First off, films are no longer cheap to make. With the advent of the digital age and easier access to technology, you have to be more strategic and efficient about your time, effort, and money when making a film. With all the possible locations and directors, there's not a need to be wasting time working on paperwork. With a website and online database, you can take the time to get that really good idea that you have worked on for years, and take the time to organize your thoughts and research better and more effectively. Doing things like this saves you so much time. You can invest time and energy into writing scripts, researching, and working with actors and actresses to help build something great and worthwhile. With any luck, you will get that great story and project financed by a company or an individual. You can then spend your time focusing on really improving the project and the story. When you pitch the project to someone, don't just ask for a buck, an honorarium, or a grant. First off, you don't need any of these things. They cost money, and you need to have some money to produce a project like this. But, in addition to that, no one really gives out cash for your ideas or projects anyway. So, if you are really passionate about your idea and want to make a film, then you need to be flexible about funding. The bottom line is that you
