Builds an external (network) DWG file (usually a "DWG" file) with the translations of the specified texts and exported entities, block attributes, dimensions, leaders and tables of the active drawing (AutoCAD) for all objects of the layer. The translation of texts is performed via the Google Translation API. The translation of all exported entities is performed by CAT-assisted tool or by human translator. A more detailed description can be found on the TRANS page. The following

DWG entities can be exported into text files: Texts, symbols, dimensions, blocks, leaders, tables, text frames, image frames, polylines, polylines, polylines, arc-curves, arc-curves, ellipse-curves, spline-curves, path points, path points, nodes, nodes, arcs, arcs, arcs, planes, planes, solids, solids, lines, lines, edges, edges, curves, curves, lines, linetypes, linetypes, line patterns, line patterns, geometric and text styles, block attributes, dimensions, blocks, blocks, 3D solids, 3D solids, dimension lines, dimensions, dimensions, dimensions, 2D solids,

TRANS is an Autocad extension designed to translate drawing texts to another language - manually or CAT-

assisted (e.g. with Trados or other CAT tool), or automatically (via Google Translate). TRANS extracts (exports) Text and Mtext entities, block attributes, dimensions, leaders and tables from AutoCAD drawings into a text file (you can then translate it using any automated text translation tool or by human translator) and then puts the translated texts back into your DWG drawing (to the original places/positions and with the original properties). The automatic mode employs the API of the online tool "Google Translate" to

perform language translation between the specified language pair. Customisation: Supported languages: Supported file types: Supported CAD tools: FAQ: Modules: This extension includes the following modules: TRANS_API - Export of text, block attributes, dimensions, leaders and tables to a text file, along with all their properties TRANS_ERROR_CODE - Error codes returned by TRANS_API function TRANS_ERROR_STRING - Error string returned by TRANS_API function

TRANS_SET - A batch export function for blocks and text entities. About the Author   This extension was developed by Rapidcad, a German development company. Rapidcad works in the field of CAD extensions and CAD-driven solutions for the analysis, creation and processing of CAD data. Supported Languages: About the translation: The module TRANS_API contains two methods, TRANSD_DATA() and TRANSD_MESSAGE(). The TRANSD_DATA() method returns a text file containing the

translated text.
TRANSD_MESSAGE() returns an empty text file.
TRANSD_MESSAGE() is used when translations are taken from an automated translation tool such as Trados or other translation tool. When translations are made from a human translator, TRANSD_DATA() is used. For example: The translated text is used in the DWG file, which means that you can store the human translation into your DWG file and translate it in the future with the same tool or other CAT tool. You can use the module

TRANS_SET to export text and block entities as well as all their properties (their local translation strings, text
