understanding this. If we have a normal arithmetic backtest where we manually place orders at every time period, are we guaranteed to make the same profit every time? If we are, then why should we choose a different strategy? A: This is basically a lack of understanding of how the dark pool works. You are correct in your statement that when you place orders the orders will be fulfilled at whatever rate the market moves in your favor, the difference with the dark pool is that the orders are intermixed with the orders of all other traders, and all orders are placed with equal priority. The backtest for mathematical dark pool algorithms will be the same all the time, and they are often used to guide your process in how to efficiently use the dark pool's liquidity. You'll often have different algorithms for different markets, and your goal will be to have the best algorithm working in the pool in order to 09e8f5149f
