Currently I have two branches: Develop and Stable. Code from dev is more then current code in Stable. I need a sublabel merge between two branches. How to do that? A: Git does not track or know about branches or labels. But you can create a third branch off the Develop branch from which you merge the Stable branch into: git checkout Develop git branch NewStable Now you can merge the develop branch into the new branch: git merge Develop Now you can use NewStable to merge the Stable branch back into: git checkout Stable git merge NewStable Vacuum tubes are widely used in various electronic equipment including television receivers and radio receivers because of their properties of high gain, low distortion, wide bandwidth, and low power consumption. However, vacuum tubes are inherently bulky, and this makes it difficult to provide smaller electronic equipment. In recent years, therefore, there have been a number of attempts to integrate semiconductor devices, such as transistors, into circuit devices which previously had employed vacuum tubes. The basic conventional tube device is typically constructed of a cathode, a grid, a control electrode, an anode, and other ancillary elements. In a conventional tube, the cathode deposits electrons onto the surface of the grid. The grid controls the location of this electron flow. When a potential

difference is applied between the cathode and the grid, a number of electron-hole pairs are generated in the grid. A
